CHANDRA P

Software Engineer | Backend & Full-Stack Development, Distributed Systems & Cloud Infrastructure

(945) 367-1129 • ravichandrapothuri471@gmail.com

PROFESSIONAL SUMMARY

Software engineer with 5+ years of experience building backend services, distributed systems, and full-stack features. Develops microservices and APIs in Go (Golang) and Java (Spring Boot), builds data pipelines and automation with Python, and integrates React and TypeScript interfaces with backend services. Current work on the Vantiva VIA platform spans Linux edge agents, gRPC transport, Kafka telemetry pipelines, and observability for AI inference workloads. At Samsung, helped support 1M+ daily events and cut API latency by 35% by tracing and batching repeated database queries. Experienced with cloud technologies including AWS and Kubernetes, automated testing, troubleshooting, and production support.

PROFESSIONAL EXPERIENCE

L&T Technology Services (LTTS) | Client: Vantiva

Golang Backend Developer *Sep 2026 – Present*

VIA | Cloud and Edge AI Infrastructure Platform

- Developed Go backend services and Linux edge agent components for a distributed AI infrastructure platform. Implemented direct collection of CPU, memory, disk, and network metrics so agents could report host health without a local Prometheus or Node Exporter installation.
- Refined gRPC communication to send structured node metrics and batches of logs from edge agents to cloud services. Improved buffering, log organization, and message handling in the Kafka pipeline that processes this operational data.
- Made Prometheus scraping configurable for GPU telemetry so deployments could use different monitoring configurations without relying on a default local Prometheus endpoint.
- Implemented node health and capacity state used in model scheduling. Added model-loading telemetry and Prometheus and Grafana monitoring to make AI inference cold starts visible.
- Wrote Go unit tests, validated telemetry output, and participated in code reviews through Git pull requests.

Samsung Electronics — Plano, TX

Software Engineer — Backend & Cloud *Sep 2023 – Aug 2026*

- Developed and operated Go microservices on AWS EKS for account and data-sync features in a Samsung consumer application. The platform handles 1M+ events per day and uses gRPC contracts between services.
- Diagnosed a slow screen flagged by QA by comparing application timings against database timings, traced the root cause to a per-record query pattern, batched the reads, and reviewed index coverage. Validated the fix through unit and integration tests and QA retesting, contributing to a 35% reduction in API latency.
- Built Kafka-based sync pipelines with asynchronous workers to absorb traffic spikes. Tuned PostgreSQL queries and indexes with the data team and added Redis caching through AWS ElastiCache, improving backend throughput by 30%. Configured routing for high-traffic APIs with Nginx and AWS API Gateway.
- Contributed to CI/CD automation with Jenkins, GitLab CI/CD, and Argo CD, helping cut deployment cycle time by 50%. Supported infrastructure provisioning with Terraform and Ansible.
- Wrote integration tests, followed OpenAPI standards, and supported incident response using CloudWatch and OpenTelemetry. Helped maintain OAuth2 and JWT access controls aligned with CCPA.

Digit Healthcare — India

Software Engineer *Jan 2021 – Aug 2022*

- Built Go and Java (Spring Boot) microservices on AWS ECS and Lambda for healthcare workflows, supporting patient and transaction processing across the software development life cycle, from requirements through production support in a multi-tenant SaaS environment.
- Investigated a claims API slowdown during peak traffic. After connection pool tuning gave only temporary relief, optimized a query that scanned excess data, removed repeated calls, and moved non-blocking work to Kafka. Validated the fix with load testing, QA, and peer review. Production monitoring confirmed stable response times under peak load, contributing to a 40% performance improvement.
- Secured REST and SOAP web services with OAuth 2.0 (OAuth2) and JWT, automated integration tests, and integrated a responsive React front end for clinical workflows. Maintained healthcare ETL pipelines for data ingestion and transformation.
- Wrote Ansible playbooks for repeatable Linux provisioning and deployed Docker services on AWS EKS using Terraform. Participated in code reviews and cross-functional incident response.

Verzeo — India

Software Engineer *Jan 2020 – Dec 2020*

- Built Go and Java (Spring Boot) services for real-time transaction processing. Used Python and Bash to automate Linux data ingestion and built ETL pipelines for transaction reporting.
- Implemented Kafka workflows for real-time fraud scoring and tuned PyTorch models to reduce missed fraud detections.
- Worked with database administrators to profile slow transaction-scoring queries, rewrite stored procedures with inefficient joins, and redesign indexes. Benchmarks showed a 35% database performance gain.
- Contributed React and TypeScript features, including state management and responsive UI. Used test-driven development and mentored junior engineers on unit testing and QA practices.

TECHNICAL SKILLS

Languages: Go (Golang), Java, Python, JavaScript (JS), TypeScript, SQL, Bash, R

Backend & APIs: Spring Boot, Node.js, GraphQL, REST APIs, SOAP web services, gRPC, OpenAPI/Swagger, microservices, distributed systems, system integration, object-oriented design, refactoring

Frontend & Web: React.js, Redux, full-stack web development, component-based design patterns, state management, responsive web design, single-page applications

Cloud & DevOps: AWS (EKS, ECS, EC2, Lambda, RDS, S3, SQS, API Gateway, ElastiCache, CloudWatch), Google Cloud Platform (GCP: BigQuery), Docker, Kubernetes, Terraform, Ansible, Jenkins, GitLab CI/CD, Argo CD, GitHub Actions, Nginx, Linux, infrastructure as code

Data & Messaging: SQL databases (PostgreSQL, MySQL), NoSQL databases (MongoDB, DynamoDB, Redis), Apache Kafka, RabbitMQ, Apache Spark, Databricks, BigQuery, ETL, data modeling, event-driven architecture

AI/ML & Observability: AI inference monitoring, GPU telemetry, Prometheus, Grafana, OpenTelemetry, PyTorch, TensorFlow, scikit-learn, Pandas, NLP, statistics and statistical analysis

Version Control & Delivery: Git, GitHub, GitLab, pull requests, code review, Agile/Scrum, continuous integration and delivery (CI/CD), software development life cycle (SDLC)

Testing & Security: Automated testing, test-driven development (TDD), unit testing, integration testing, load testing, OAuth 2.0, JWT, technical support for production systems, incident response, root cause analysis, HIPAA, SOX, and CCPA compliance

Collaboration: Cross-functional collaboration, problem-solving, verbal and written communication skills, translating customer needs and business objectives into software requirements

---

ACADEMIC PROJECT EXPERIENCE

Real-Time Data Pipeline & Predictive Analytics — University of North Texas | MS Data Science Capstone | 2023–2024

- Built an end-to-end, real-time ETL pipeline with Python, Apache Kafka, Apache Spark, Databricks, and BigQuery to ingest and transform data. Applied NLP and statistical analysis in R to analyze the resulting datasets.
- Trained and validated forecasting models with TensorFlow and scikit-learn using feature engineering, hyperparameter tuning, and cross-validation. Presented results through interactive dashboards for technical and business audiences.

EDUCATION

Master of Science in Data Science — University of North Texas, Denton, TX | 2022–2024

PROFESSIONAL DEVELOPMENT

- Walmart Global Tech — Advanced Software Engineering Job Simulation (Forage)
- Cybersecurity Job Simulation — Risk and APT Analysis (Forage)

KEY ACHIEVEMENTS & IMPACT

- Samsung Electronics: Supported 1M+ daily events, reduced API latency by 35%, and improved backend throughput by 30%.
- Samsung Electronics: Helped cut deployment cycle time by 50% through CI/CD automation.
- Digit Healthcare: Contributed to a 40% performance improvement for healthcare workflows, with a zero-downtime rollout.
- Verzeo: Improved database performance by 35% on transaction-scoring workloads.
